Fleet Management for Land Rigs

Star Information Systems AS (SIS) provides fleet management software for ships and rigs. SIS is a company created by pioneers in the field of fleet management who have been instrumental in the industry since 1967. Since SIS's inception in 1997 we have seen strong growth and today our world-wide network of subsidiaries and agents forms the basis of our customer support.

The SIS systems cover all areas of fleet management including:

- Maintenance
- Dockings
- Spares and inventory
- Purchasing- including electronic commerce
- Safety Management
- Insurance
- and more...

All modules are independent yet can also form a completely integrated system. The SIS software is uniquely designed to make it easier to learn for the people onboard and easier to maintain for the head office.

The software is used onboard and in the office: Coordination occurs through our robust, secure and cost effective data replication engine or on-line features.

The aim of the SIS systems is to improve efficiency and profits through:

- Improved maintenance and condition control
- Manage and follow-up audits, non-conformities, incidents, and near-misses
- Cross fleet comparisons
- Efficient data replication
- Reduced operational costs
- Tighter budget and cost control
- Optimized inventory use
- Efficient purchasing processes
- Reduced risk exposure and reduced insurance premiums

With the Star system managers can be assured of meeting the requirements within their own company and of external parties such as classification societies, national administrations and international organizations.

A dynamic, credible and professional partner for our customers.

One system covering all areas

Star Information System's fleet management solutions were initially developed to meet the needs of off-shore drilling companies. It has also proven to be perfect of all types of rig fleet management (in off-line or on-line environments).

The Star IPS modules enable office managers, rig engineers and workers to:

- Propose budgets and control costs
- Schedule future work and report work done
- Issue requisitions and direct purchases
- Control inventory
- Control and distribute all types of documents such as QA procedures
- Evaluate equipment criticality and condition
- Organize overhauls and surveys
- Follow-up certificates and expiry dates
- Manage crew and payroll
- Report and follow up incidents and non-conformities
- Asset management across sites
- Compare rigs performance across the fleet

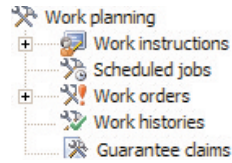

In either off-line or on-line environments you can control:

Material and services:

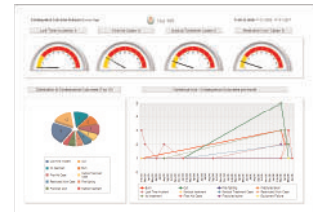

Inventory control of all material related to rig supply, integrated with central purchasing, logistics and electronic commerce.

Work planning:

All work related tasks such as maintenance, repair, surveys and project activities can be scheduled and reported.

Reports:

Reports can be designed according to the owner's requirements and presented on the web or as printouts. Indicators (KPI) can be created for all data available.

Safety:

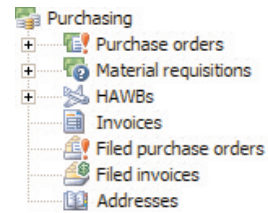

Helping designated persons and management to record incidents and non conformities and to ensure that required corrective actions are implemented.

Projects (Overhauls):

Enables coordination between modules in regard to major repairs/overhauls and conversions. Generating specifications, handling quotes, contracts and follow-up. The Star Project module improves cost control and reports "work done" back into the maintenance module.

Purchasing:

Inventory control of all material related to rigs' supply, integrated with central purchasing, logistics and electronic commerce.

Budget:

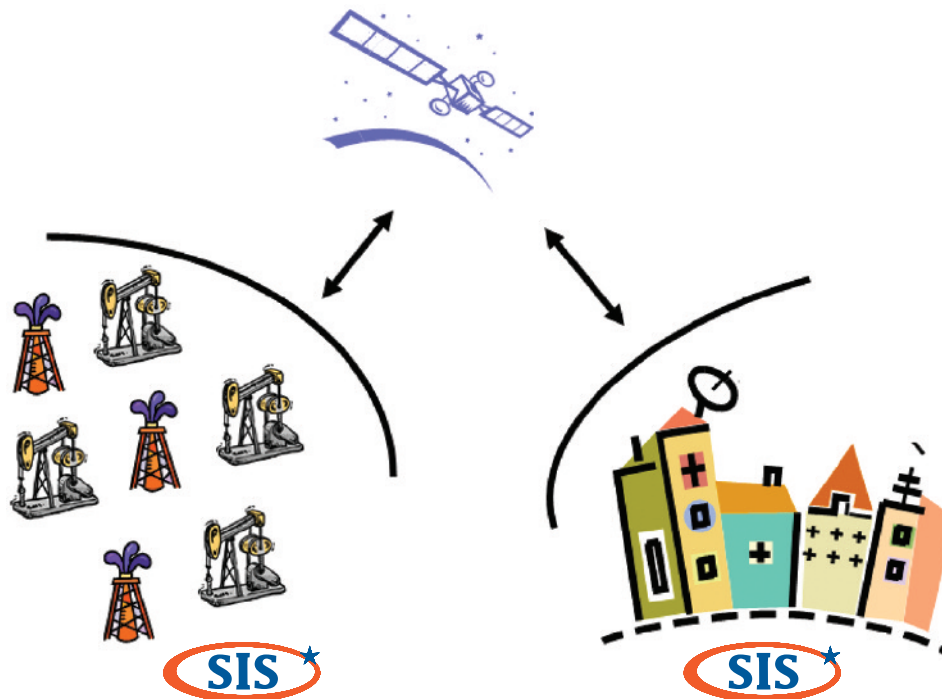

The budget is presented in a matrix between finance and technical accounts. The system may be integrated with external budget and cost control tools, and has a built in gateway to various accounting systems.

Documents:

Distribution of all types of documents to the fleet. Automated notifications to the user about new or modified documents. Automated certificate of posting receipt. Document revision and commenting.

Asset management:

Move equipment across the fleet or to repair shop. Central control of equipment whereabouts and history.
